

CASE STUDY: DIGITAL PRINTING

The Problem:

During the operation of a digital flatbed press, static was building on the corrugated plastic substrates causing the printer numerous problems such as ink over-spray and clogged inkjets. This static caused delays in effectively completing print jobs, increased ink and substrate costs, and damage to expensive ink-jet cartridges.

The Solution:

Our time proven Model 400T Ion-Edge Static Eliminator Bar resolved the problem. The high performance AC bar was mounted to the printer and the customer reported the results were immediate and on target. The static was eliminated and the customer is back to producing high quality print work.

Ion-Edge Model 400T eliminates ink overspray and clogged inkjets
